Reviews

Good e-book and beneficial one. I was able to comprehend everything out of this published e pdf. Once you begin to read the book, it is extremely difficult to leave it before concluding.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 54 pages. Original publisher: Urbana, Ill. : Coordinated Science Laboratory, College of Engineering, University of Illinois at Urbana-Champaign, 1989 OCLC Number: (OCoLC)67712178 Excerpt: . . . computation overlap in order to obtain linear speedups. However, if the interconnection speed is not matched with the computation speed, then overlap will not be possible. Having a fast crossbar without arbitration delays provides the necessary communication speed to obtain linear speedups. Note that since computation and communication can overlap, this mapping is also applicable to systolic algorithms. 2. 2. Separable Convolution A two dimensional convolution is separable if it can be replaced by two one dimensional convolutions. The main advantage of separability is that the computational requirements per pixel are reduced from $2w^2$ to $4w$. We illustrate the mapping by giving an MIMD algorithm to run on a cluster. The data is parat oned among the processors as follows. Each processor is assigned N/P rows of the da Processor P_i gets rows $(i-1)N/P$ to $iN/P-1$. Each processor computes convolution along the rows using a window of size w . Once processor P_i finishes convolution along the rows, it needs rows $(i-1)N/P-w+1$ to $(i-1)N/P$, from processor P_{i-1} , and similarly, it needs the bottom $w-1$ rows from $iN/P-w$ to $iN/P-1$ from processor P_i . Therefore, a processor needs to communicate with only two processors to obtain the desbed intermed ate data. The boundary processors P_0 and P_{i-1} only need to communicate with one other processor. Note that ff the granule size with each processor is less than w^2 (i. e. , $N/P < w^2$) then the...
