The historical estimate of the NAIRU derives from an econometric estimate of a Phillips curve, which is an equation that relates the change in inflation to the unemployment rate and other variables, including changes in productivity trends, oil price shocks, and wage and price controls in effect in the early 1970s. Specifically, CBO estimates a NAIRU for married men - a group with very high and stable labor force attachment during the normal working years and with a low average unemployment rate. It then estimates a NAIRU for specific age sex groups on the basis of the observed relationship between each groups unemployment rate and that of married men. The overall NAIRU is derived from the group-specific rates, so demographic shifts are directly factored into CBOs estimates. The NAIRU is only one of several indicators that CBO uses to forecast inflation in the short run. CBO also considers information about productivity, sectoral price pressures, 3 unusual developments in labor markets, and (occasionally) inflation-measurement issues. For example, an apparent shift to higher productivity growth in the late 1990s, changes in medical costs, and unusually low energy prices and declining import prices in 1998 and 1999 help to explain the very low inflation seen in those years. The analysis of labor mar-ket developments in this paper is just one of the ways in which CBO seeks to evaluate the usefulness of, and improve the...
