CHAPTER XI FUNDAMENTAL PROPERTIES OF ALTERNATING-CURRENT ARTIFICIAL LINES A.C. artificial lines are composed of uniform sections, either π s or l s. The series elements of these sections ordinarily contain resistance and reactance, and the shunt elements, or leaks, conductance and susceptance. There are two fundamental problems which frequently present themselves in discussing the relations between real and artificial a.c. lines. The first is to find the elements of a T or l section which shall make the section correspond to an assigned length of real line at an assigned frequency. The second is, knowing the impedance and admittance element of an artificial line section, at a given frequency, to find the line angle and surge impedance of the section at that frequency. We shall consider these two problems...
